

Delphi Telematics Module

Delphi's Telematics Module integrates a phone, global positioning satellite receiver and digital signal processing to enable communication between a vehicle and a response center. By accessing a vehicle's data bus, the response center can provide navigation assistance, remote diagnostics and remote door lock/unlock in addition to other services that help enhance driver safety and security.

▶ Benefits

- GPS vehicle location identification
- Can be customized to specific vehicle architectures
- Enhances driver safety and security

▶ Features

- Vehicle interface unit
- Microphone
- Global Positioning System (GPS) and cellular antennas
- One-button calling to response center
- Data exchange between the vehicle and response center
 - Stolen vehicle tracking
 - Remote vehicle lock/unlock
 - Emergency requires
 - Collision detection and call center notification
 - Hands-free call center communication
 - Theft detection and reset
